MISSION
“...to pursue excellence in Native American health care by promoting education in the medical disciplines, honoring traditional healing principles and restoring the balance of mind, body and spirit.”

This publication was made possible by cooperative agreement number 1U38OT000161 from the Centers for Disease Control and Prevention (CDC) and the Association of State and Territorial Health Officials (ASTHO). Its contents are solely the responsibility of the authors and do not necessarily represent the official views of CDC or ASTHO.
What is influenza (the flu)?
The flu is a contagious respiratory illness caused by influenza viruses that infect the nose, throat, and lungs. It can cause mild to severe illness. At times, it can lead to death.

Who should get a flu vaccine?
Everyone 6 months and older should get a flu vaccine, especially if you are at high risk for complications, or if you live with or care for someone who is high risk for complications.

Your family may be especially vulnerable to the flu.
Influenza poses a greater risk to certain people, including pregnant women, children, and elders, who are all at high risk for flu-related complications. In fact, pneumonia and flu are a leading cause of death among Native elders. The flu also can cause certain health conditions, including diabetes, asthma, and heart and lung disease, to become worse. Pneumonia and bronchitis are examples of serious flu-related complications, which can result in hospitalization and sometimes even death.

The influenza vaccine is safe. You can’t get the flu from the flu vaccine.
People have been receiving flu vaccines for more than 50 years. Vaccine safety is closely monitored annually by the Centers for Disease Control and Prevention (CDC) and the Food and Drug Administration (FDA). Hundreds of millions of flu vaccines have been given safely to people across the country for decades.
The viruses in the flu shot are killed and the viruses in the nasal spray vaccine are weakened, so neither vaccine can cause the flu. A flu shot can have mild side effects, such as soreness or swelling where the vaccine was received, a mild fever, or aches. Mild side effects of the nasal spray can include runny nose, headache, sore throat, and cough. Any side effects you experience are not contagious to others and should disappear within 2 days.

Why do I need to get a flu vaccine each year?
You need a flu vaccine each year because influenza viruses are always changing and immunity wanes over time. Each year, experts identify the influenza viruses that are the most likely to cause illness during the upcoming flu season. Your flu vaccine protects against those viruses. It does not protect against other viruses (such as colds or stomach viruses) or against very different influenza viruses not in the vaccine.

Where do I get a flu vaccine?
- Your local healthcare facility (even if you don’t have a regular doctor or nurse)
- Mobile and community-based immunization clinics that visit many locations
- Pharmacies and grocery stores (where available)
- Ask your Community Health Representative (CHR) or Community Health Aide (CHA) for more information.
